## **Continuation Sheet (PTO-303)**

Application No.

Applicant argues that the prior art does not teach allocating freed bandwidth from a terminated stream to another stream within the same class. The examiner respectfully disagrees. The prior art clearly teaches a hard isolation technique wherein bandwidth are shared among subclass data flows or streams of a class (Packer, col. 14, 2.3, hard isolation and soft isolation). Therefore, free available bandwidth can be shared and protected among subset flows or streams of the class. The prior art also teaches soft isolation wherein free available bandwidth can be shared among different classes. Therefore, it would have been obvious to allocate free bandwidth to streams belong to a same class first then to streams from another class so that bandwidth needs from flows of a same class (such as a same company or building) will be satisfied first in order to increase efficiency in terms of managing free bandwidth according to an area of classification. Furthermore, given broadest resaonable interpretation, "selecting an existing data stream based ...on where... the existing data stream is within the hierarchical policy tree" is just either selecting a stream from a same or different class of the terminated stream. In section 2.1, Packer describes a hierarchical tree of classifications wherein leaf nodes contains policies, wherein policies are created by a network manager. 2.2.2 describes excess information rate wherein BW allocation is distributed on a "as available" basis (whenever BW is released) and BW is allocated to 10 VoIP streams on an application classfication. It is obvious that when 10 streams are satisfied, unused BW can be allocated to other classification flows.
